Run ID: web-live-snapshot

Generated: 2026-09-12T07:39:08.038337Z

Status: success

Executive Summary

SPY is in an uptrend, but breadth participation is mixed and short-term breadth momentum is negative. Sector-rate sensitivity is broadly negative across most sectors, with XLE the only positive_significant sector and XLF not statistically significant.

Confirmed signals

- SPY is in an uptrend.
- Breadth is stronger on the 200dma measure than on the 50dma measure.
- Breadth momentum over 20 days is negative.
- Most sector-rate relationships are negative_significant.
- XLE is the only positive_significant sector-rate relationship in the pack.

Risk flags

- Negative_significant rate sensitivity is present across multiple sectors, including XLY, XLK, XLI, XLRE, and XLU.
- Breadth momentum is negative despite the broader uptrend.
- Breadth data may be subject to survivorship bias.
- Sector-rate results are one-factor associations and may omit other drivers.

Market Participation

- % Above 50DMA: 38.1%
- % Above 200DMA: 58.5%
- Advancers: 349
- Decliners: 152
- Advance/Dcline Ratio: 2.30
- Breadth Momentum (20D): -30.5 percentage points
- Breadth status: available

Participation is uneven: 58.5% of valid names are above the 200dma, but only 38.1% are above the 50dma, and 20-day breadth momentum is negative.

Visualization unavailable for this run.

Trend Conditions

- Adjusted Close: \$765.63
- SMA20: \$766.95
- SMA50: \$758.64
- SMA200: \$712.06
- Distance to SMA20: -0.17%
- Distance to SMA50: +0.92%

- Distance to SMA200: +7.52%
- Trend regime: Uptrend

The validated trend regime is uptrend. SPY is above the 50dma and 200dma, while remaining slightly below the 20dma.

Visualization unavailable for this run.

Sector Rate Sensitivity

Yield unit: percentage points. Sector yield coefficients describe statistical association and exposure, not causation.

Sector	Beta	95% CI	p-value	Obs.	+10bp	Significance
XLC	-0.0647	[-0.0966, -0.0328]	<0.001	252	-0.65%	Negative — Significant
XLY	-0.0960	[-0.1389, -0.0531]	<0.001	252	-0.96%	Negative — Significant
XLP	-0.0478	[-0.0737, -0.0218]	<0.001	252	-0.48%	Negative — Significant
XLE	0.1233	[0.0804, 0.1663]	<0.001	252	+1.23%	Positive — Significant
XLF	-0.0261	[-0.0575, 0.0054]	0.104	252	-0.26%	Negative — Not Significant
XLV	-0.0678	[-0.0972, -0.0383]	<0.001	252	-0.68%	Negative — Significant
XLI	-0.0779	[-0.1162, -0.0395]	<0.001	252	-0.78%	Negative — Significant
XLK	-0.0701	[-0.1303, -0.0099]	0.023	252	-0.70%	Negative — Significant
XLB	-0.0929	[-0.1309, -0.0548]	<0.001	252	-0.93%	Negative — Significant
XLRE	-0.0795	[-0.1104, -0.0487]	<0.001	252	-0.80%	Negative — Significant
XLU	-0.0597	[-0.0958, -0.0237]	0.001	252	-0.60%	Negative — Significant

Validated sector-rate exposure is mostly negative_significant across sectors, with XLE positive_significant and XLF negative_not_significant. This indicates heterogeneous sector sensitivity to rates within the pack.

Visualization unavailable for this run.

Data Quality

- Available equity tickers / universe size: 501 / 503
- Latest 50DMA valid count: 501
- Latest 200DMA valid count: 499
- SPY observation coverage (cleaned / raw): 1255 / 1255
- DGS10 usable observation coverage (usable / raw): 1247 / 1303
- Available sectors: 11
- Valid regressions: 11
- Insufficient regressions: 0

Warnings

- no usable prices returned for DG
- no usable prices returned for OKE

Methodology and Limitations

Breadth indicators measure how many constituents with a complete moving-average window sit strictly above their 50-day and 200-day averages, together with advance/decline counts from valid one-day returns. Missing history is excluded

from denominators rather than treated as below average.

SPY trend classification uses complete-window SMA20, SMA50, and SMA200 values and the accepted regime labels from the quantitative layer. This report repeats the stored `trend\_regime` and does not reclassify it.

Sector yield regressions are one-factor daily associations between sector returns and changes in the 10-year Treasury yield. A one-factor specification omits other market and macro factors. Coefficients, confidence intervals, and sensitivity labels are copied from the validated summary. Association is not causation.

Historical breadth using the current S&P 500 constituent universe is subject to survivorship bias.

The pipeline is deterministic through quantitative output and charts. OpenAI interpretation is an optional later layer. This report only assembles already validated artifacts and does not call a language model or recompute indicators.

Additional validated limitations

- Yield changes are measured in percentage points. A move from 4.30 to 4.35 is 0.05, not 0.0005.

Disclaimer

This interpretation is limited to the supplied validated evidence pack and does not provide investment advice, forecasts, or trading recommendations.
